Executive Summary

Finding your dream house is a stressful and time consuming process. Usually, we brainstorm first. Then start reading websites, newspapers and magazines that have real estate listings, and make comparison. After that, calculate the mortgage payment and make a decision.

The purpose of my project is to simplify this process and save hours of time for users. They can just use an excel file to find their dream house.

Implementation

There are three steps in my projects.

Step 1: Search Online and Get Housing Information

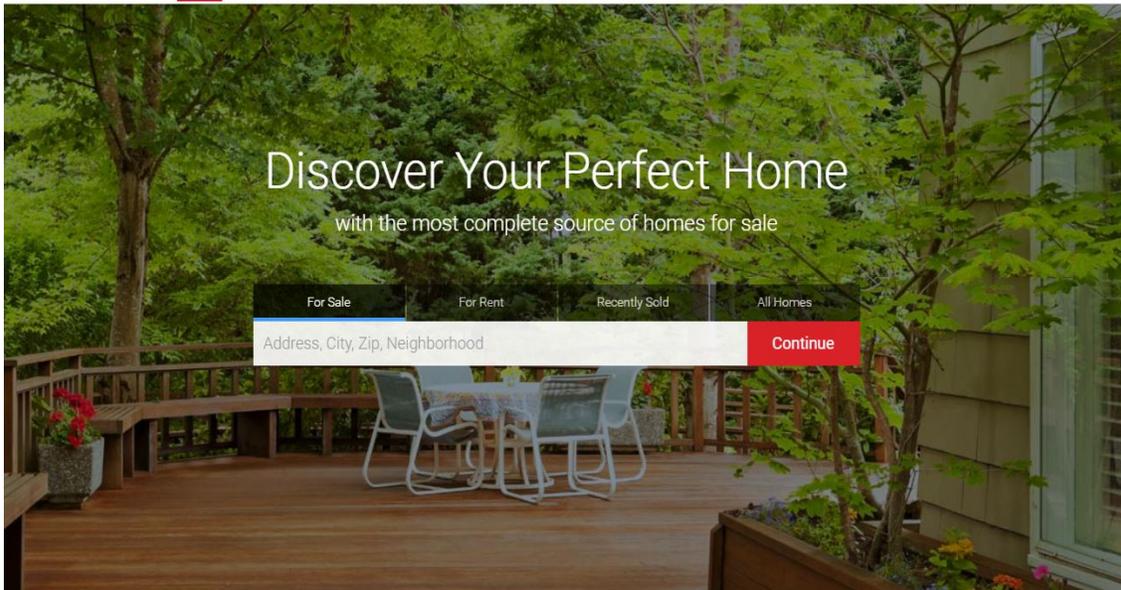

Step 2: Calculate the Mortgage Payment

Step 3: Decision Making: Monte Carlo Stimulation

I created ribbons for each of them and below I will describe and explain it separately.

Step 1: Search Online and Get Housing Information

The first worksheet in the excel file helps users search the real estate information from <http://www.realtor.com>.

They can enter either the zip code or the name of city when searching housing information. A user form will be popped up, asking the zip code, if they don't know, they could click "I don't know the ZIP", and another user form will be shown to ask the name of city and state.

A dialog box titled "Real Estate Information Search" with a close button (X) in the top right corner. The text inside reads "Please enter the zip code of the city you want to search:" followed by a text input field. Below the input field are three buttons: "OK", "Cancel", and "I don't know the ZIP".A dialog box titled "Real Estate Information Search" with a close button (X) in the top right corner. The text inside reads "Please enter the name of the city you want to search:" followed by a text input field. Below that, it says "and also the abbreviate of the state name:" followed by another text input field. At the bottom are two buttons: "OK" and "Cancel".

There is another worksheet called “Cities”. In this worksheet, all cities in the United States are listed, about 40,000 in total. The code will validate the city name and the state name that users entered, if the name is wrong, then the procedure will stop. Other than that, it will automatically list all real estates in that area, including the price, address, how many bedrooms and bathrooms, space, lot size, property type and a link to get more information. This process is achieved by automating internet explorer.

Real Estate and Homes for Sale							
Please enter the zip code of the city you want to search:							
*If you don't know the zip code, Please enter the name of the city:							
and the abbreviate of the state name:							
							Provo

Step 2: Calculate the Mortgage Payment

The second worksheet in the excel file helps users calculate the mortgage payment. When they click the ribbon “Loan and Interest”. A user form will be

shown to require some information, such as annual interest rate, number of years, payments per year, loan amount and type of the payment.

Loan Amortization

Please enter the annual interest rate: %

Please enter how many years you plan to pay the loan:

Please enter the number of payments per year:

Please enter the price of the real estate:

Please enter the loan amount:

Please choose the type of payment:

Begin of the year

End of the year

OK Cancel

A reference table of the interest rate is at the top of the worksheet. Since there are so many banks, and each of them has a different annual percentage rate, there is no standard. So users need to type in the annual interest rate, based on their credit score and the bank they want to choose. For number of years, usually, people will choose 10 years fixed mortgage, 15 years, or 30 years.

After entering all those information, the table below will displays how much interest and principal they need to pay in each period. And also the total interest and total mortgage payment, as shown in the following picture.

Loan Amortization

Annual Percentage Rate (Reference Only)		Interest Rate (in decimal form)	3.37%
10 year fixed mortgage	3.304%	Number of Years	15
15 year fixed mortgage	3.374%	Payments Per Year	12
20 year fixed mortgage	3.723%	Price	\$500,000
30 year fixed mortgage	3.946%	Loan (Financed Amount)	\$390,000
		Type (Begin=1, End=0)	0

Year	Period	Payment	Interest	Principal	End of Period Balance	Total Interest	Total Mortgage Payment
0	0	\$0.00	\$0.00	\$0.00	\$390,000.00	\$107,515.09	\$497,515.09
1	1	\$2,763.97	\$1,096.55	\$1,667.42	\$388,332.58		
1	2	\$2,763.97	\$1,091.86	\$1,672.11	\$386,660.47		
1	3	\$2,763.97	\$1,087.16	\$1,676.81	\$384,983.66		
1	4	\$2,763.97	\$1,082.45	\$1,681.53	\$383,302.13		
1	5	\$2,763.97	\$1,077.72	\$1,686.26	\$381,615.87		
1	6	\$2,763.97	\$1,072.98	\$1,691.00	\$379,924.87		
1	7	\$2,763.97	\$1,068.22	\$1,695.75	\$378,229.12		
1	8	\$2,763.97	\$1,063.45	\$1,700.52	\$376,528.60		
1	9	\$2,763.97	\$1,058.67	\$1,705.30	\$374,823.30		
1	10	\$2,763.97	\$1,053.88	\$1,710.09	\$373,113.21		
1	11	\$2,763.97	\$1,049.07	\$1,714.90	\$371,398.31		
1	12	\$2,763.97	\$1,044.25	\$1,719.72	\$369,678.59		
2	13	\$2,763.97	\$1,039.41	\$1,724.56	\$367,954.03		
2	14	\$2,763.97	\$1,034.56	\$1,729.41	\$366,224.62		
2	15	\$2,763.97	\$1,029.70	\$1,734.27	\$364,490.35		
2	16	\$2,763.97	\$1,024.83	\$1,739.15	\$362,751.20		
2	17	\$2,763.97	\$1,019.94	\$1,744.04	\$361,007.16		
2	18	\$2,763.97	\$1,015.03	\$1,748.94	\$359,258.22		
2	19	\$2,763.97	\$1,010.11	\$1,753.86	\$357,504.36		
2	20	\$2,763.97	\$1,005.18	\$1,758.79	\$355,745.57		
2	21	\$2,763.97	\$1,000.24	\$1,763.74	\$353,981.83		
2	22	\$2,763.97	\$995.28	\$1,768.69	\$352,213.14		
2	23	\$2,763.97	\$990.31	\$1,773.67	\$350,439.47		

Step 3: Decision Making: Monte Carlo Stimulation

The final step is to make a right choice. In real world, we compare price, place, space and some other features of the house. We will ask our spouse, our parents and our child as well. In order to simplify this procedure, I created a worksheet called "Decision Making".

Users need to give points to each house, based on some criteria. For example, I feel the price for house 1 is more affordable than house 2. Then, I will give 10 points to house 1 and 4 points for house 2. Cells have a light blue background needs to be filled in before they start the procedure.

Those three steps save hours of time for us in searching, comparing and making decision.

Conceptual Difficulties

Problem 1: Different Format in the Website Source

I encountered with many problems when doing this project, the hardest one is in automating internet explorer. For our homework, we did a project about the Chicago food. But the code of each record in that website has the same format. However, when I did this project, the format are different at <http://www.realtor.com>. For example, the price of the real estate may reduce because of seasonality. Then, three lines of code will be adding inside, as shown in the following picture.

```
<span class="srp-item-price-reduce" itemprop="price">  
  <i class="ra ra-arrow-down color-green"></i>  
</span>
```

What's more, some records don't have information about the bedrooms and bathrooms, or have "3+" bedrooms. If I use string type, then another problem

would come that I cannot make comparison, and “Make Comparison” ribbon would not work.

In order to solve this problem, I created two agents, getting a piece information in the first agent and using the other agent to cut down the information. Then many if statements applied in this agent to solve the missing value problem. If the record has “3+” bedrooms, just keep 3 in the table.

Problem 2: Validate the Name of the City and State

As I mentioned before, users could enter the name of city and state to search for the real estate. However, validating the name is hard. I downloaded the city information from a website by each state. As for an international student, it is surprised to know that there are so many cities in the United States, about 38,000 in total.

When comparing strings, I am not familiar with the “StrComp” statement, and I am not sure whether the output is True/False, or 0/1. Therefore, at the beginning, my code didn’t work well when users enter city name and state name.

Problem 3: Link to the Websites

At the beginning, I planned to insert the pictures for each real estate. I successfully wrote the code and input those pictures. Then I realized that if I don’t put the links, then users couldn’t see more information. But when users open the links, the pictures just located in the middle of the websites. For this reason, pictures are redundant. Therefore, I deleted pictures in the table.

But another problem appeared, although the data type of “More Information” is string, and it contains the address of the websites, it doesn’t link to that page automatically. I tried recording macros, but seems it didn’t work. Finally, I found if I use “Format Painter”, the address is hyperlinked to the websites.

Problem 4: Web Query and Formula Problem in Loan Amortization

In the “Loan Amortization” worksheet, there are many formulas applied to calculate the interest and principal. At first, I used a wrong formula, and I haven’t realized. Then I found I have many negative number in “End of Balance”, which doesn’t make sense. I checked it twice, and eventually figured out the problem.

In this worksheet, I also planned to do a web query to get the annual percentage rate. But those information are protected in many websites, and since each bank has a different mortgage rate, I decided to give up this idea and just left a reference table at the top.

Problem 5: Hard to Clean the Tables Because of Formulas

In the “Decision Making” sheet, there are many tables, and most of the tables include formulas. Therefore, if I just use “ClearContents” statement, then all those formulas would be gone. Since I only wrote code for Monte Carlo Stimulation but not for those tables, I need to keep all formulas. After struggling for a while, I realized I could change the font color to solve this problem.

Those five problems are the main difficulties I met when doing this project.

Assistance

I searched many statements, such as “Instr”, “StrComp”, and “ClnG” on Google, but I did this project entirely by myself.

Learning

This semester is the first time for me to learn about the programming. As for a beginner, it is hard to grasp all the concepts. I met with many problems in our homework and didn't know which statements should be used.

When I learned “Automating Internet Explorer”, there were errors again and again. Even if I wrote the same code as Ar. Allen, that code didn't work for me. In the “Chicago food” homework, I dimmed more than 25 variables in order to get it worked. In “Big Boggle” project, I spent three hours just to figure out how to randomize the location of each grid. I had thinking about dropping this class since it is too hard for a beginner, but eventually I decided not to give up in the half way.

But now, I have successfully did my final project. It looks professional and works just as I had expected. Although there are things that could be improved, such as don't let users to delete rows or change the name of worksheet etc. I still feel very proud of myself. I hope it works efficiently to help users in finding their dream house.
